Data Types Jigsaw

Javascript has six primitive data types:
1. Boolean
2. Undefined
3. Null
4. Number
5. String
6. Symbol (new in ECMAScript 6; we will not focus on this in the beginning)

Assignment

You're going to do some research on one of the 5 data types we are focusing on, then share with the class. We'll follow this protocol:
- 2 min: Independent research using MDN
- 2 min: group discuss findings, ask/answer questions
- 3 min: group makes chart to share takeaways
  - Keep in mind: What are possible values? Examples? Does this data type get commonly confused with something else? Why/when would developers use it? Provide an example of it being used in code!
- 30 sec - 1 min: each group presents to the class, while not presenting, you are taking notes on what you're learning from other groups
